

1. Two blocks 1 and 2 rest on a frictionless horizontal surface. They are connected by three massless strings and two frictionless, massless pulleys as shown below. .

(a) Draw the free-body diagram for each block and each pulley.

(b) Find the acceleration of the each block

Fig. 1

$$(b) \quad \begin{cases} 3T = m_2 a_2 \cdots \cdots (1) \\ F - 2T = m_1 a_1 \cdots (2) \\ 2a_1 = 3a_2 \cdots \cdots (3) \end{cases}$$

因為 m_1 受滑輪組之拉力是 m_2 受滑輪組之拉力的 $2/3$ 倍
故 m_1 之位移是 m_2 之位移的 $3/2$ 倍

$$(1), (3) \rightarrow 3T = \frac{2}{3} m_2 a_1 \cdots \cdots (4)$$

$$(2), (4) \rightarrow \begin{cases} a_1 = \frac{9F}{9m_1 + 4m_2} \\ a_2 = \frac{6F}{9m_1 + 4m_2} \end{cases}$$

2. A small block of mass m rests on the sloping side of a wedge of mass M which itself rests on a horizontal table as shown in Fig. 2. Assuming all surfaces are frictionless.

(a) Draw the free-body diagram for each block and determine the acceleration of each block.

Assume $M = 3m$, $\theta = 37^\circ$, $g = 10 \text{ m/s}^2$

Find the minimum value of the external force (F) such that the mass m leave the surface of the wedge .

(b) Find the acceleration of each block when (i) $F = 2mg$ and (ii) $F = 5mg$.

Fig. 2

(a)

\vec{a}'_m 為 the mass m 相對於 wedge 之加速度

$$\begin{cases} F + N \sin \theta = Ma_M \\ mg - N \cos \theta = ma_{my} \\ N \sin \theta = ma_{mx} \end{cases} \Rightarrow \begin{cases} F + N \sin \theta = Ma_M & \text{--- (1)} \\ mg - N \cos \theta = ma'_{mx} \tan \theta & \text{--- (2)} \\ N \sin \theta = m(a'_{mx} - a_M) & \text{--- (3)} \end{cases}$$

$a_{my} = a'_{my}$
 $a_{mx} = a'_{mx} - a_M$
 $a'_{mx} \tan \theta = a'_{my}$

(1),(3) $F = Ma_M - m(a'_{mx} - a_M)$

(2),(3) $mg = ma'_{mx} \tan \theta + m(a'_{mx} - a_M) \cot \theta$

$M = 3m$
 $\theta = 37^\circ$ $\Rightarrow \begin{cases} F = 4ma_M - ma'_{mx} \\ mg = \frac{25}{12}ma'_{mx} - \frac{4}{3}ma_M \end{cases}$

$\Rightarrow \begin{cases} a'_{mx} = \frac{4F + 12mg}{21m} \\ a_M = \frac{25F + 12mg}{84m} \end{cases}$ 代回得 $N = \frac{5(12mg - 3F)}{84}$

When $F \geq 4mg$ the mass m will leave the surface of the wedge.

(b)

(i)

$$\text{When } F \leq 4mg, \quad N = \frac{5(12mg - 3F)}{84}$$

$$\rightarrow F = 2mg, \quad N = \frac{5}{14}mg$$

$$\begin{cases} F + N \sin \theta = Ma_M \\ mg - N \cos \theta = ma_{my} \\ N \sin \theta = ma_{mx} \end{cases}$$

$$\rightarrow \begin{cases} a_M = \frac{31}{42}g \\ a_{my} = \frac{5}{7}g \\ a_{mx} = \frac{3}{14}g \end{cases}$$

(ii)

$$\text{When } F \geq 4mg, \quad N = 0$$

$$\rightarrow F = 5mg, \quad N = 0$$

$$\begin{cases} F + N \sin \theta = Ma_M \\ mg - N \cos \theta = ma_{my} \\ N \sin \theta = ma_{mx} \end{cases}$$

$$\rightarrow \begin{cases} a_M = \frac{5}{3}g \\ a_{my} = g \\ a_{mx} = 0 \end{cases}$$

3. The double Atwood machine shown in Fig. 3 has frictionless, massless pulleys and cords. Determine (a) the acceleration of mass m_A , m_B , and m_C , and (b) the tensions F_{TA} and F_{TC} in the cords.
 $m_A = 3\text{Kg}$, $m_B = 2\text{Kg}$ and $m_C = 5\text{Kg}$

Fig. 3

$$F_{TA} = F_{TB}$$

$$F_{TC} = 2F_{TA} \quad \text{---} \cdot \text{---} \Rightarrow \quad \text{因pulley無質量}$$

$$a_A = a' + a_C$$

$$a_B = -a' + a_C$$

$$(a) \quad \begin{cases} F_{TA} - m_A g = m_A a_A \\ F_{TB} - m_B g = m_B a_B \\ m_C g - F_{TC} = m_C a_C \end{cases} \quad (b)$$

$$F_{TC} = 2F_{TA} = 5(g - a_C)$$

$$F_{TA} = \frac{120}{49} g, \quad F_{TC} = \frac{240}{49} g$$

$$\downarrow$$

$$\begin{cases} F_{TA} - 3g = 3(a' + a_C) \cdots \cdots (1) \\ F_{TA} - 2g = 2(a_C - a') \cdots \cdots (2) \\ 5g - 2F_{TA} = 5a_C \cdots \cdots (3) \end{cases}$$

$$(1), (2) \quad g = -5a' - a_C$$

$$(2), (3) \quad g = -4a' + 9a_C$$

$$\rightarrow a' = -10a_C$$

$$\rightarrow \begin{cases} a_C = \frac{1}{49} g \\ a' = -\frac{10}{49} g \end{cases}$$

$$\rightarrow \begin{cases} a_A = -\frac{9}{49} g \\ a_B = \frac{11}{49} g \\ a_C = \frac{1}{49} g \end{cases}$$

$a_A < 0$ 代表 m_A 的加速度的方向與假設的方向相反

m_A 的加速度為 $\frac{9}{49} g$ 向下
